

Many young people and busy adults forget to apply deodorant during the day, leading to missed hygiene and awkward stinky moments, and existing products do not provide a simple, universally compatible, reliable way to track daily use or alert users when they might forget. This problem is common. People often realize too late that they forgot, whether they are rushing through a morning routine, distracted by work or school, or sharing a bathroom. Most users currently rely on memory alone, which can be inconsistent. A system that automatically tracks deodorant use and sends timely reminders could prevent these inconveniences, improve daily hygiene habits, and give users peace of mind.
